

* Recursive Code - int K;

```
int Rec(i, height) {
```

```
    if (i == n-1) return 0;
```

```
    if (i >= n) return INT_MAX;
```

```
    int minCost = INT_MAX;
```

```
    int start = i+1
```

```
    int end = i + K
```

```
    for (int j = start; j <= end; j++) {
```

```
        // jumping from i to jth step, so add jump cost
```

```
        int jumpCost = abs(Height[i] - Height[j]);
```

```
        int nextCost = Rec(j, height); // Jump and get result from jth step
```

```
        if (nextCost != INT_MAX) {
```

```
            // We could reach top (n-1)
```

```
            // so this current path is valid
```

```
            int curPathCost = jumpCost + nextCost;
```

```
            minCost = min(minCost, curPathCost);
```

```
        }
```

```
    }
```

(index) stairs $\rightarrow$ 0 1 2
 (values) Height $\rightarrow$ 20 10 30, $n=3$ (Top $\Rightarrow n-1$)
 answer $\Rightarrow |20-30| = 10$
